- 9 atmospheric initial conditions from ECMWF
- and 3 ocean initial conditions from Mercator

Régime zonal (NAO+)

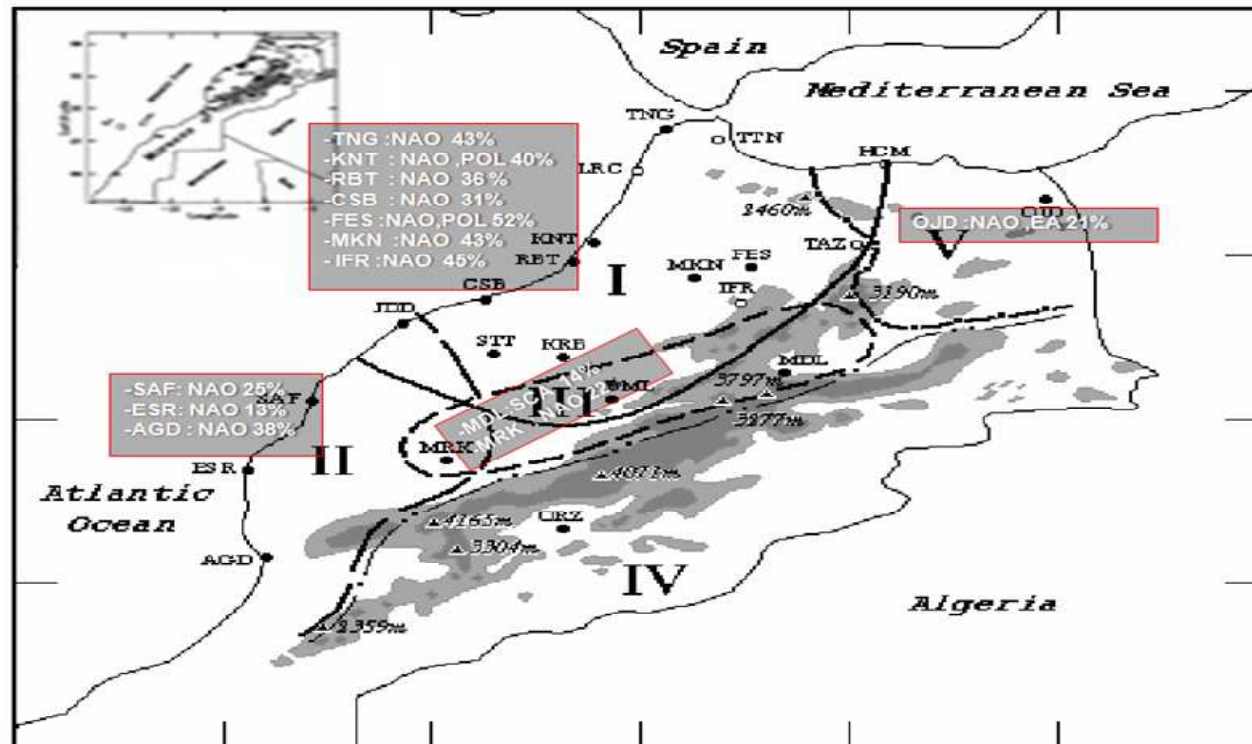

Anticyclone groenlandais (NAO-)

Observed relative changes (%) in mean precipitation , the frequency of wet days and the frequency of intense precipitation days for NAO+ and NAO- (Z500 weather regimes).

Saison d'hiver

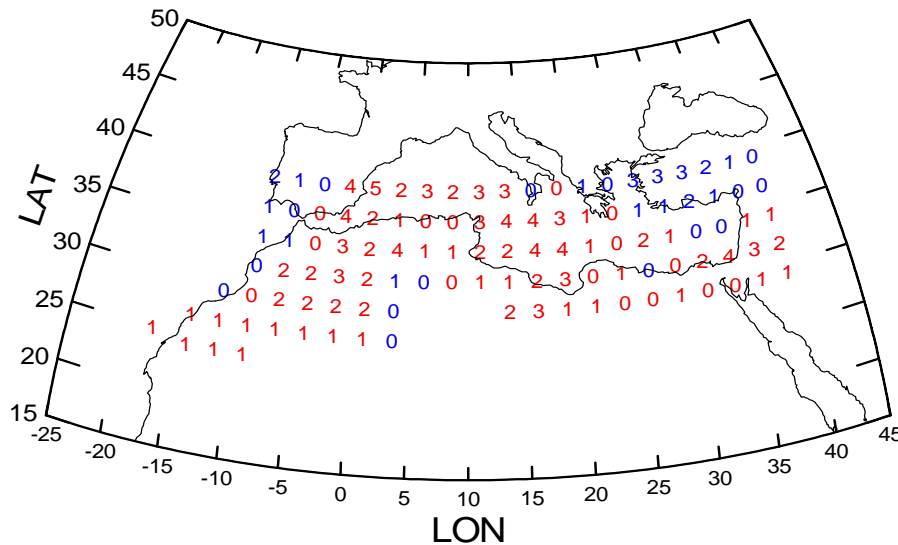

Thanks to Wafae Badi

-NAO est le plus prédominant: de 13% à 45%

Correlation (*10), Red = positive, Blue = negative

Jan-Feb NAO
Versus
Jan-Feb precipitation

Oct-Nov NAO
Versus
Oct-Nov precipitation

Taken from Neil Ward presentation done in Rabat, Morocco - November 15th, 2012

NAO seems to have an influence on temperature extremes that relationships tend to be stronger with warm extremes than cool extremes.

Figure 6. Relationship between chosen extreme indices and ENSO or NAO during boreal winter (DJF). (a) Spearman rank correlation between DTR and the SOI index, (b) correlation between TXx and NAO, + (–) indicate positive (negative) correlations. Significant correlations ($p \leq 0.05$) are marked with a circle. Correlations are calculated for as long as each station provides homogeneous data. (c) Scatter plot for de-trended area-average TXx anomalies during 1961–2010 in the western part of the investigation area (Mauritania, Morocco, Algeria, Tunisia, Libya) and NAO, (d) as (c) but for TX90p.

Regression Prediction of Jan-Feb Region 1 rainfall from Jan-Feb values of NAO index and Scandinavian index

Rainfall region as given in previous slide
NAO and Scandinavian atmospheric mode indices from NOAA/CPC

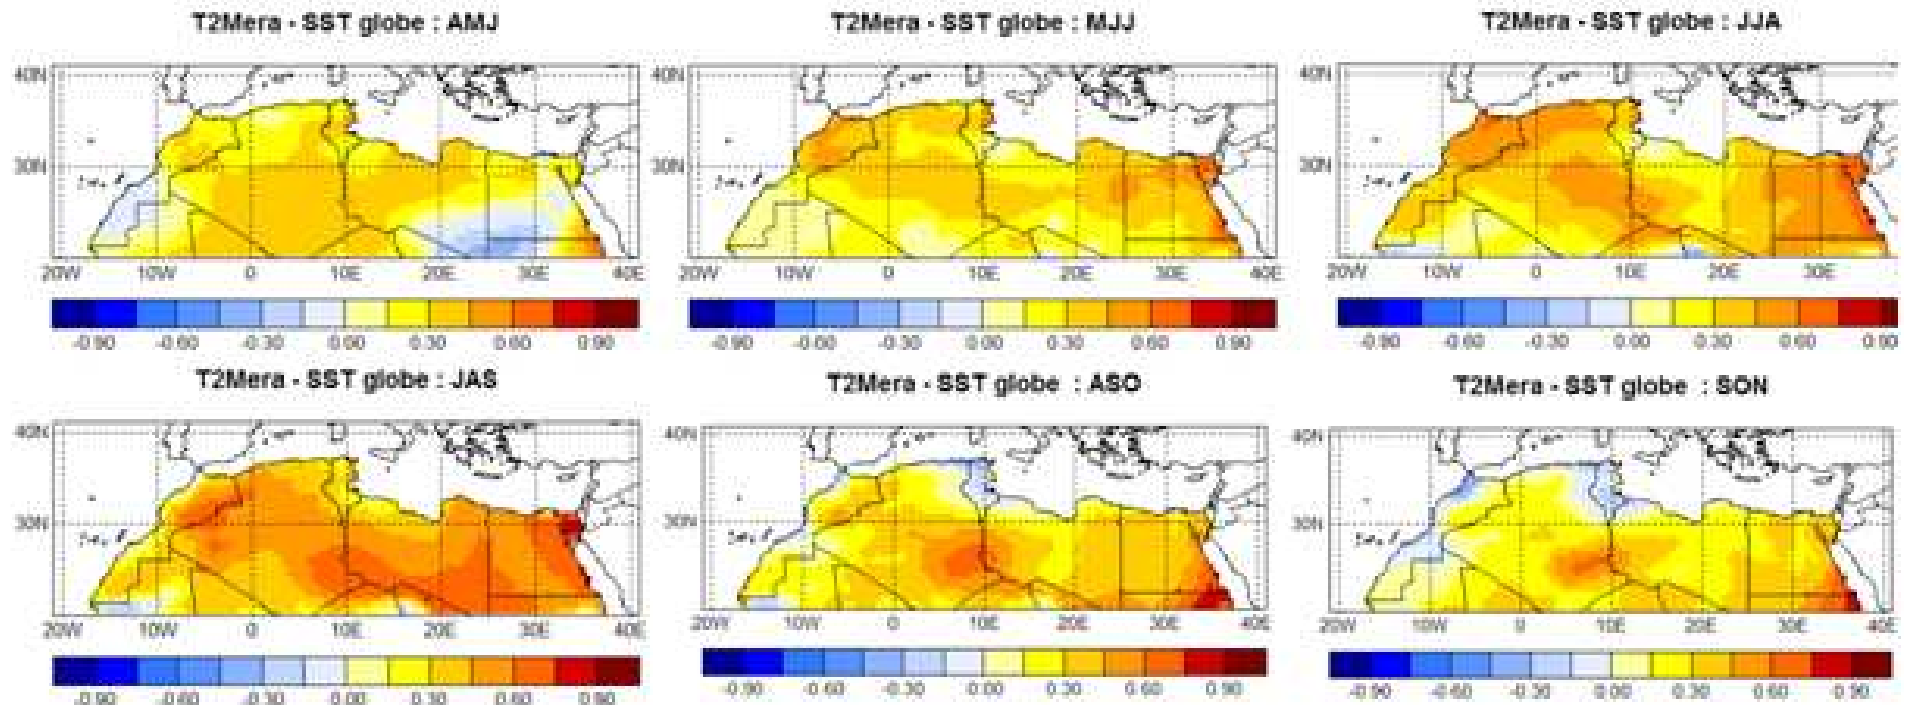

Taken from Neil Ward presentation done in Rabat, Morocco - November 15th, 2012

Nicholson and Kim (1997) and Ward et al. (1999) shows some influence of ENSO on north-west African rainfall: the positive phase leads to fewer precipitation in spring. Knippertz et al. (2003) for 1982-1983 and 1991-1992

The spring of the second year was dry in many Moroccan stations: 1983, 1992, 1998, 2003, 2005 et 2007 (driouech (2010))

Correlation between observed and predicted air temperature based on SST

Corrélation entre les températures ERA-intérim et celles prévues par la méthode ACC appliquée sur la SST du globe et testée par la cross-validation. Les corrélations supérieures à 0.3 sont significatives à 90% par un t-test.

Impact SST du globe sur les températures à 2m issues de 20 stations synoptiques du MAROC

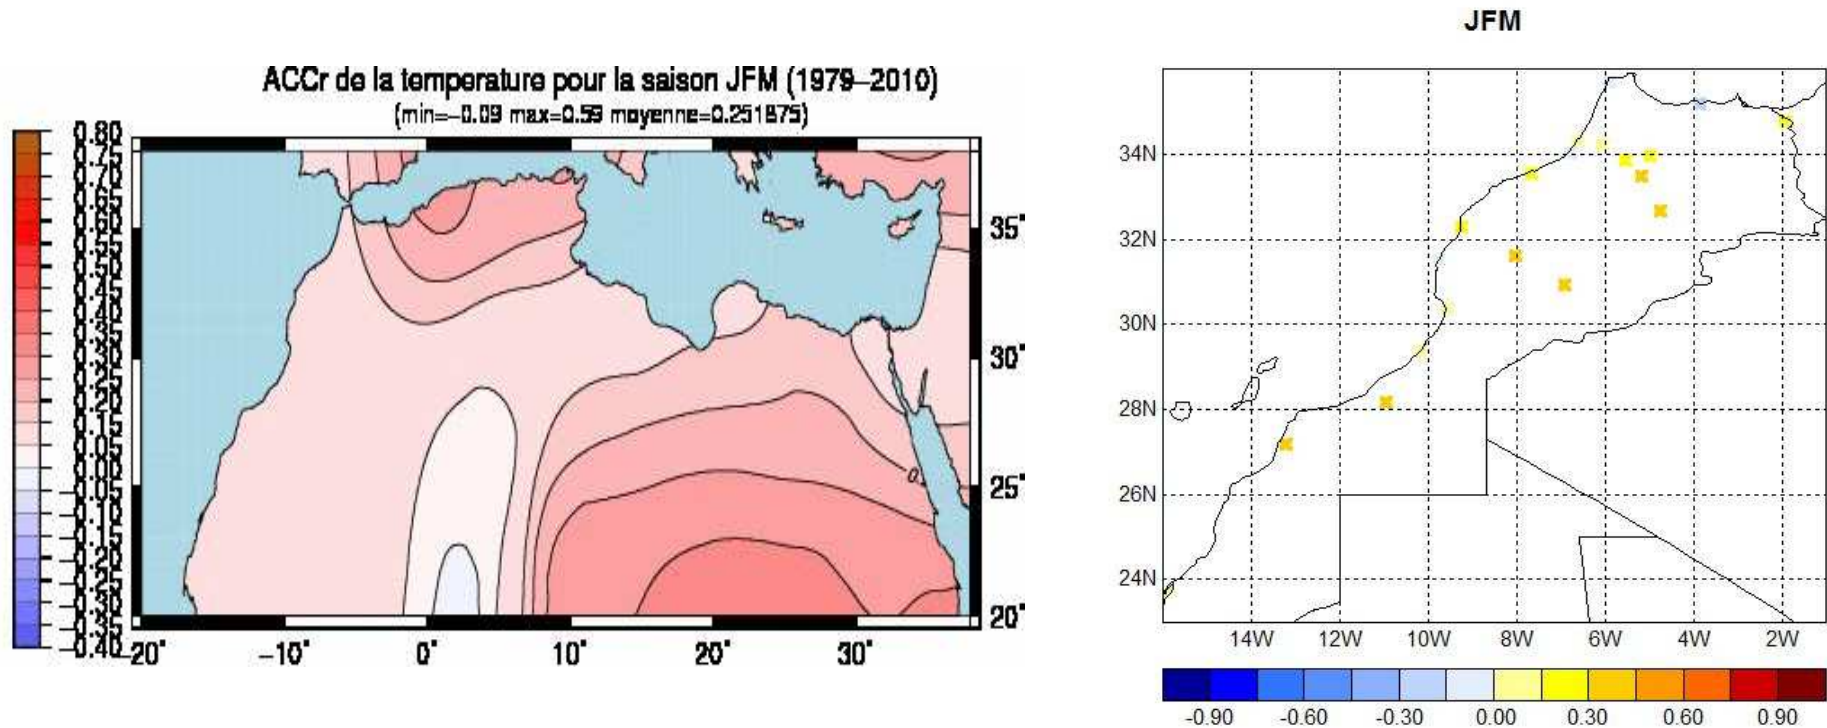

Champ de corrélation entre les températures synoptiques et celles prévues par la méthode RCP appliquée sur la SST du globe

C/C :-La majorité des stations synoptiques ont manifesté une prévisibilité depuis le début MAM jusqu'à la fin de la période chaude (ASO)

-Alors que, pendant la période froide (de SON à FMA) la prévisibilité est généralement faible dans la plupart des stations.

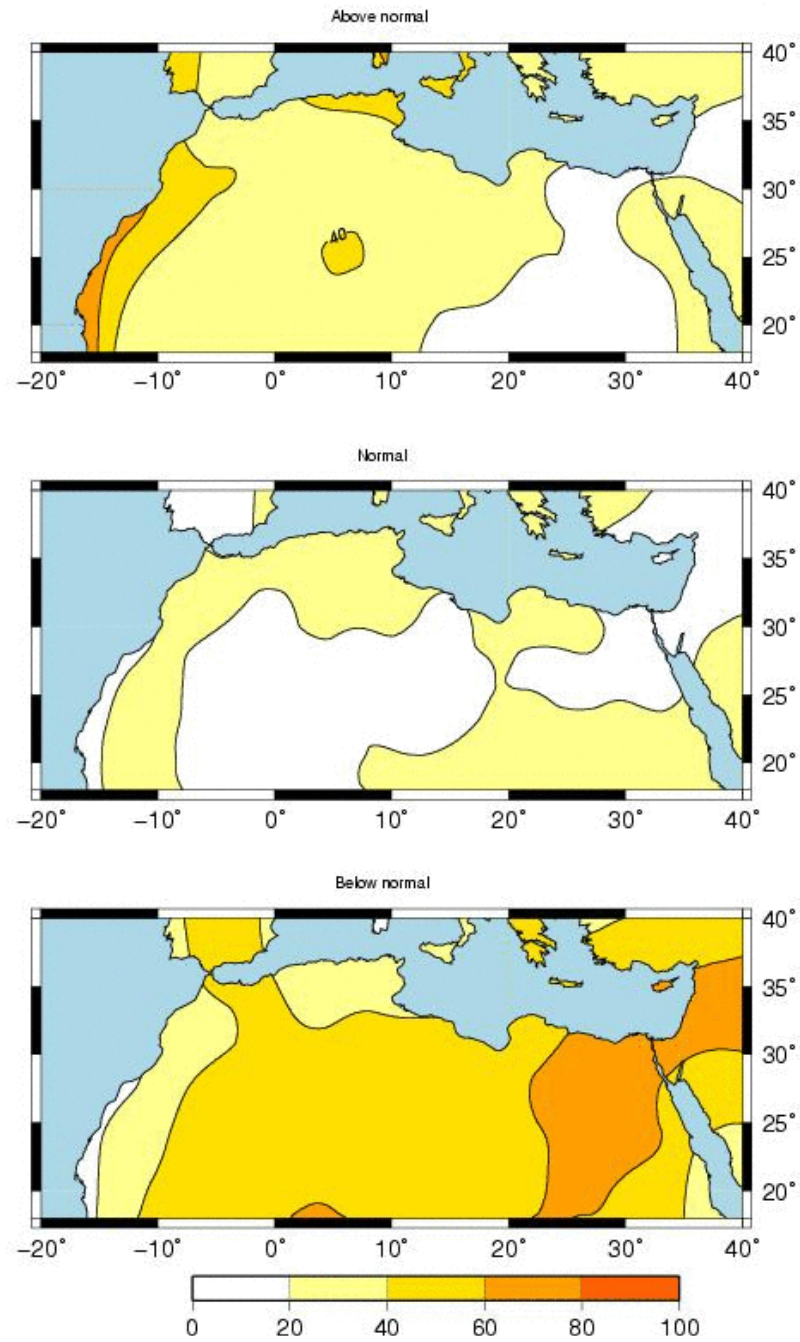

Apport de l'adaptation statistique utilisant Z500 issue d'ARPEGE-Climat pour la T2m sur le Maroc

C/C : L'utilisation de l'adaptation statistique a permis d'améliorer la performance de la prévisibilité des températures à 2m sur le Maroc pour les saisons JFM, FMA et MAM (fin d'hiver et printemps)

Seasonal outlook

Outlook for November-December-January 2013/2014 over North Africa

The overall analysis of temperatures forecasts issued from different models for NDJ 2013/2014 shows probably normal to above normal conditions over Morocco, Libya and Egypt. No special scenario is found over Algeria and Tunisia. For precipitation, normal to below normal conditions are likely over North African countries except Egypt where normal to above normal conditions are more likely.

P.S: We note that seasonal forecasts issued from ARPEGE-Climat are given in probabilistic form from March 2013

Tables summarizing seasonal forecast for November-December-January 2013
in North Africa

1- Seasonal temperatures forecast

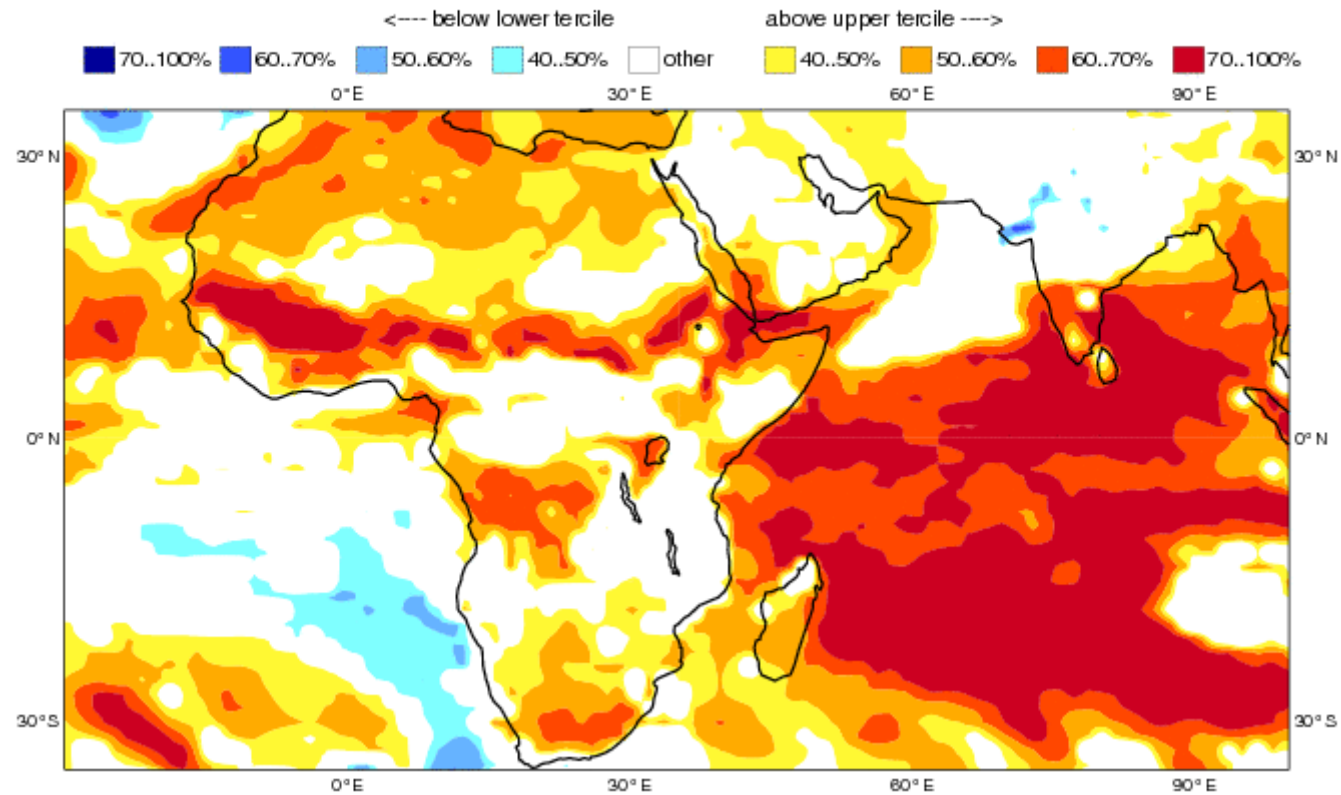

Model	Morocco	Algeria	Tunisia	Libya	Egypt
<i>ARPEGE-Climat</i>	 N  S			 to 	
<i>ECMWF</i>		 N  S		 to 	 to 
<i>UK Met-Office</i>				 to 	 to 
Synthesis	Probably normal to above normal	No special scenario	No special scenario	Probably normal to above normal	Probably normal to above normal
