C3S seasonal forecast service

multi-system setup

IMPLEMENTED BY

Climate
Change

C3S seasonal forecast service

Protocol:

- time of submission of data; time of publication of forecasts (13th of each month)
- ensemble size (forecasts: ~50 members; hindcasts: ~25 members)
- reference period: 1993-2016 (24 years)

Data:

Variables

- Surface
 - 9 vars every 6h
 - +20 vars every 24h
- Pressure (11 levels, from 925 hPa to 10 hPa)
 - 5 vars every 12 h

Horizontal grid: global 1deg x 1deg

C3S data service: the Climate Data Store

- Interface to data archives and download and analysis tools
- Does not require collocation of data; access is provided through ‘adaptors’ to existing repositories
- The Climate Data Store (CDS) and toolbox
 - launched in mid-June 2018, with seasonal forecasts available from first release.
 - access is via click-on forms or API
 - the current ‘source’ of C3S seasonal forecast data is the ECMWF MARS archive; this imposes some limitations on the options available to the data service (see later)
- Software (tools) and software development environment are provided in the CDS

Seasonal forecast data in the CDS

Caveats

- The encoding of monthly means (derived from provider data) is incomplete.
- Metadata describing post-processing is not included in the data files (e.g. the anomaly files do not hold information about the baseline used as reference).
- The characterisation of data in the CDS/toolbox common data model has issues, which make it difficult (and possibly unsafe) to use toolbox with seasonal forecasts at present.
- For some providers, data from more than one system version is archived, but there is no option to select only one system before download; as a temporary solution, we recommend downloading in grib format, using off-line grib tools to select the desired system, then performing processing (including conversion to other formats)

Plans for progress on data service:

- fix problems which currently prevent use of seasonal forecasts in the toolbox;
- improve encoding of monthly-mean data from lagged-start ensemble to make it useable;
- develop toolbox applications to allow download of ‘meaningful’ subsets of data;
- define formatting standards to encode products.

IMPLEMENTED BY

Climate
Change

C3S seasonal forecasts – next steps

- Generate and display **verification scores for products** presented in the graphs
 - Add monthly-mean graphical products

IMPLEMENTED BY

Climate
Change

C3S seasonal forecasts – next steps

- Generate and display **verification scores for products** presented in the graphs
 - Add monthly-mean graphical products
- Add **new providers to the multi-system**; regularly generate data and graphical products from all contributors
 - GPC Washington and GPC Tokyo – early 2019
 - also, possibly, GPC Montreal and GPC Melbourne later in 2019

IMPLEMENTED BY

Climate
Change

C3S seasonal forecasts – next steps

- Generate and display **verification scores for products** presented in the graphs
 - Add monthly-mean graphical products
- Add **new providers to the multi-system**; regularly generate data and graphical products from all contributors
 - GPC Washington and GPC Tokyo – early 2019
 - also, possibly, GPC Montreal and GPC Melbourne later in 2019
- Introduce **new products** in the C3S suite of outputs
 - probability forecasts for ENSO indices
 - indices of atmospheric circulation (NAO, SOI)
 - products based on within-season statistics (frequency/length of spells)
