## SPECS empirical seasonal forecasts

Past observations are used to deduce significant correlations between the weather in the last three months (up to the beginning of the month) and the weather over the next season (from the end of the month). The main predictors are El Niño / La Niña and the trends due to global warming. Overfitting is avoided as much as possible. The system has been documented in [Eden et al, 2015](#) (under review).

### SPECS empirical seasonal forecasts

Past observations are used to deduce significant correlations between the weather in the last three months (up to the beginning of the month) and the weather over the next season (from the end of the month). The main predictors are El Niño / La Niña and the trends due to global warming. Overfitting is avoided as much as possible. The system has been documented in [Eden et al, 2015](#).

We are debugging a new version, please disregard the plots for a few days...

## SPECS Empirical Seasonal Forecast: Surface air temperature (DJF 2017) Ensemble mean anomaly (wrt 1980-2010)

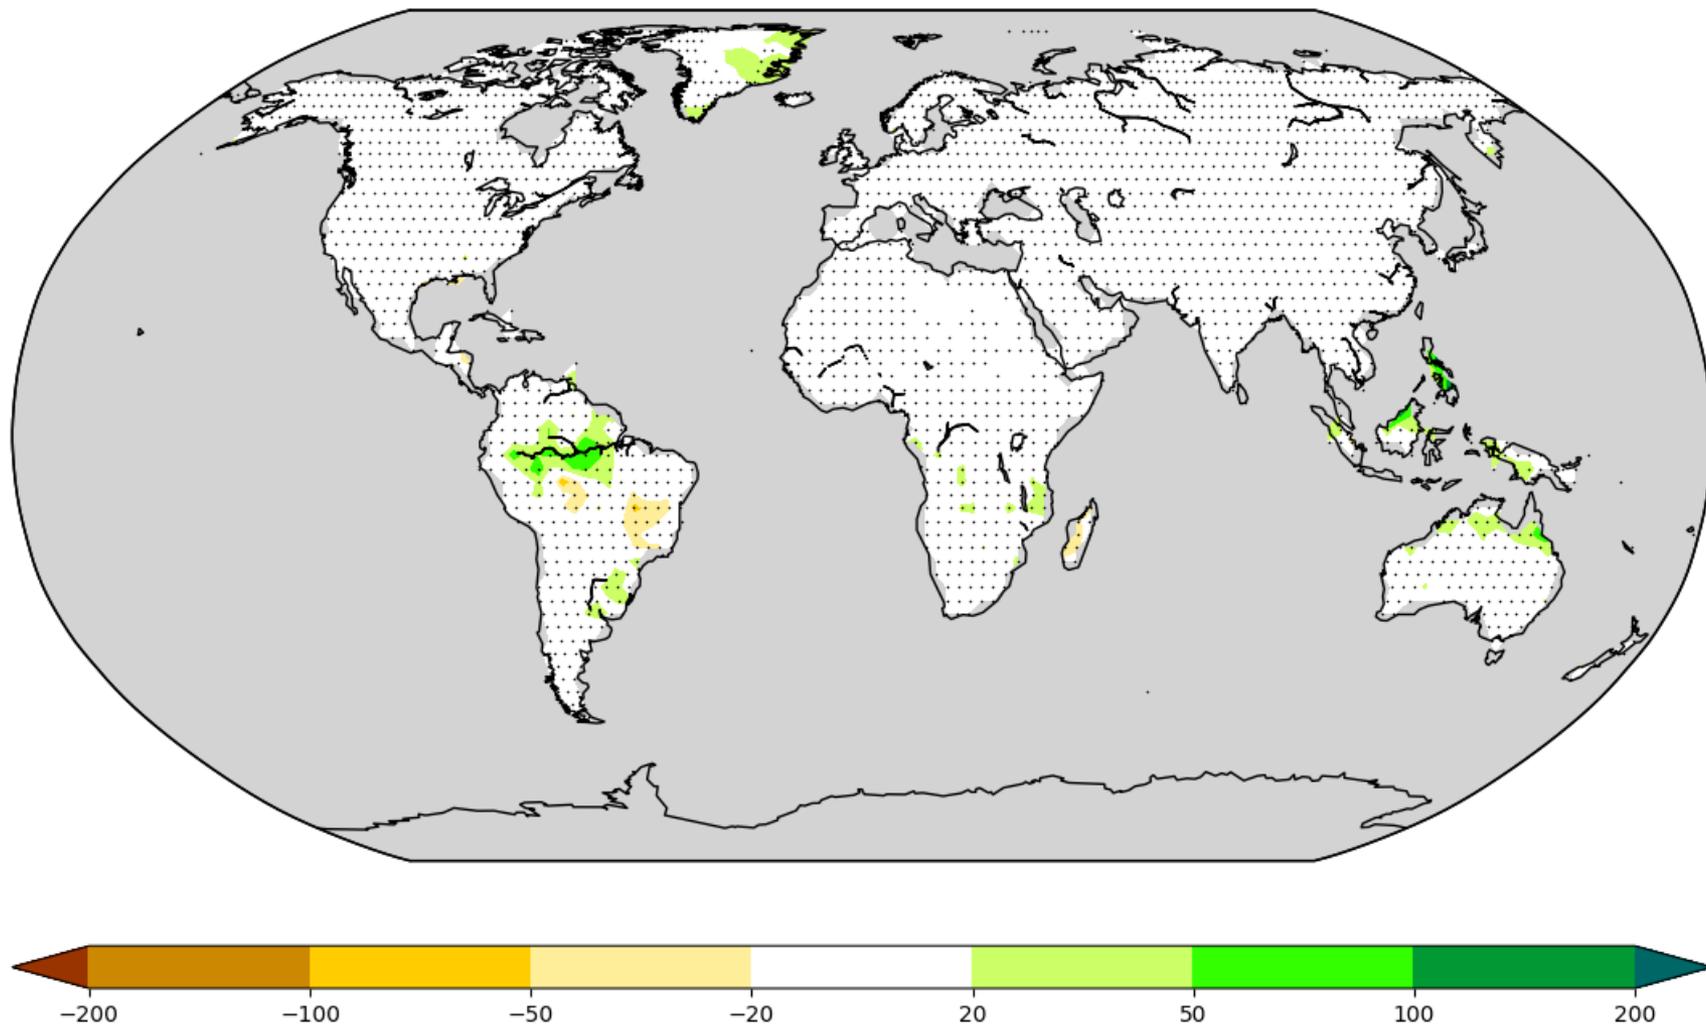

Ensemble size: 51 | Forecast generation date: 15/11/2017 | Stippled where NOT significant at 10% level | base time: Nov 2017

## SPECS Empirical Seasonal Forecast: Surface precipitation (DJF 2017)

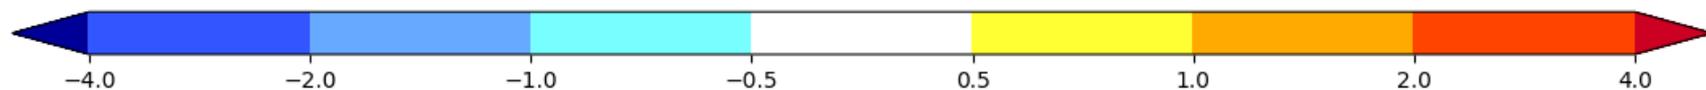

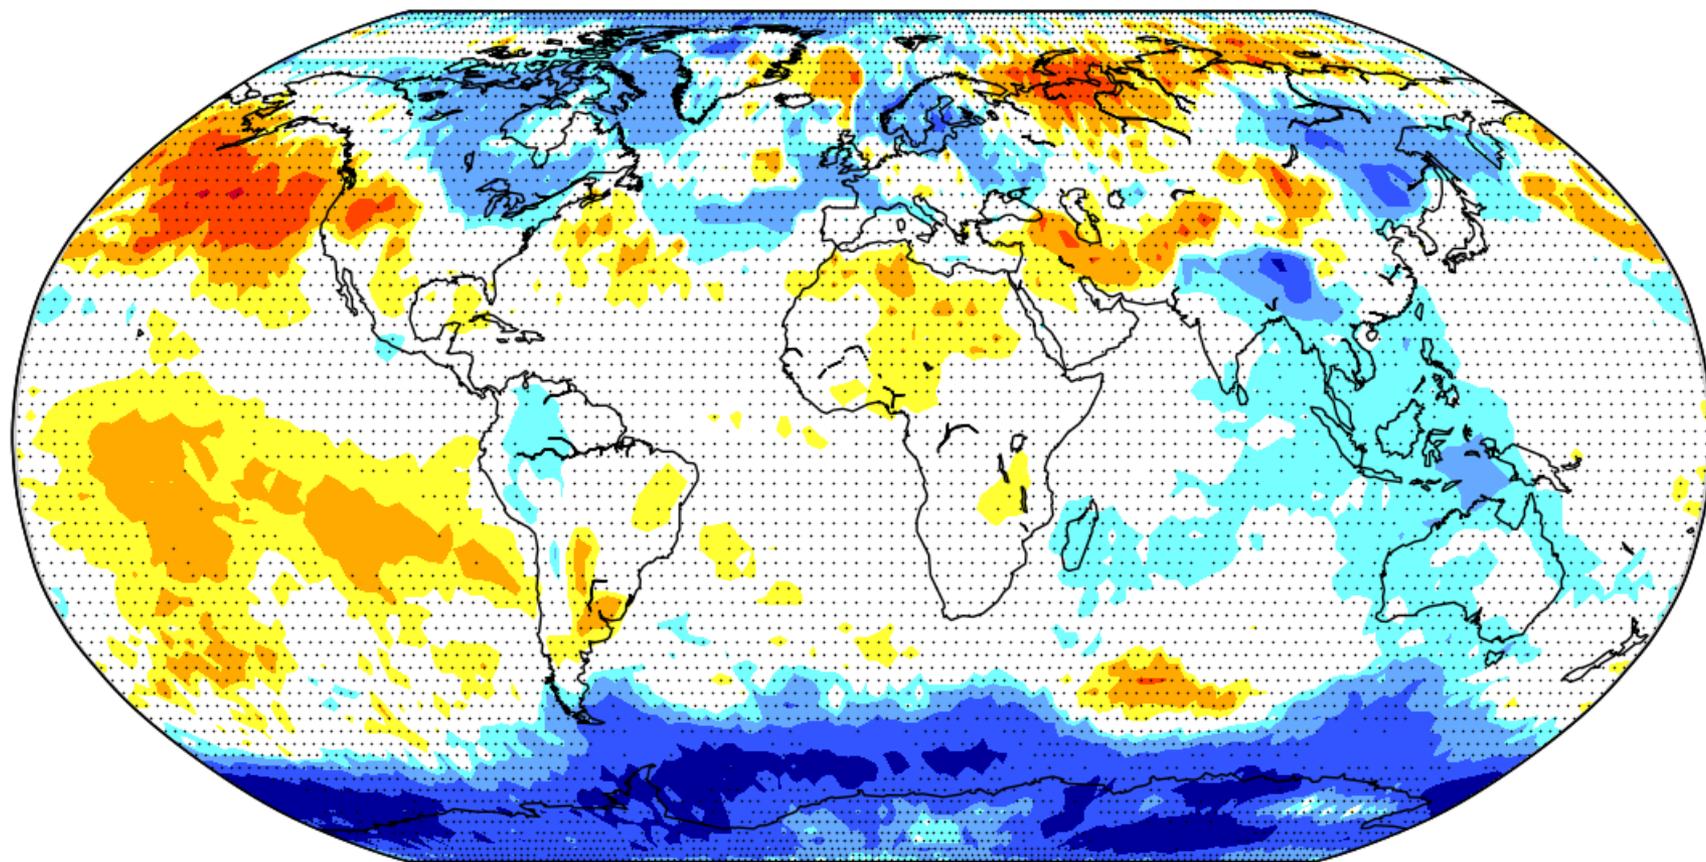

Ensemble mean anomaly (wrt 1980-2010)

Ensemble size: 51 | Forecast generation date: 15/11/2017 | Stippled where NOT significant at 10% level | base time: Nov 2017

## SPECS Empirical Seasonal Forecast: Mean sea level pressure (DJF 2017) Ensemble mean anomaly (wrt 1980-2010)

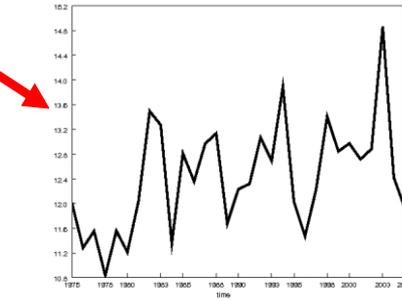

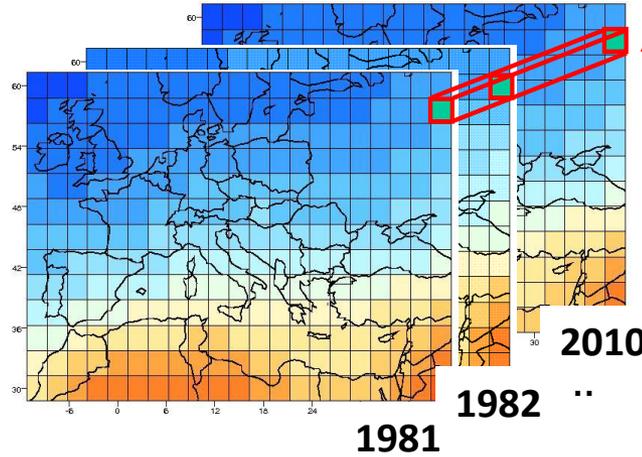

Ensemble size: 51 | Forecast generation date: 15/11/2017 | Stippled where NOT significant at 10% level | base time: Nov 2017

# Hazard Outlook – DJF 2017-2018

- A coherent signal of higher than normal temperature is present over a large part spanning from Central to Eastern Europe and Central to Eastern Mediterranean basin.
- Drier than normal conditions signal are expected over the Mediterranean. It is essentially super-imposed onto regions where drought is already present since early this year.
